Abstract of **EP1066964**

The bearing has an element arranged in the tool axis at the intersection point between the tool and the drive shaft. The element has an axially projection connecting cone (20), which engages a corresponding recess (24) on the drive shaft. The element is releasably held at determined angle and is centred and secured against rotation. The cone preferably has an undercut inner bore, which engages a clamping rod (26,26') in the drive shaft.
